

Thomas Wen

New York City Metropolitan Area | (908) 251-2656 | twen40@gatech.edu | US Citizen

Objective

Highly motivated, conscientious student with a love for teaching and a proven track record of delivering high-impact software and systems projects. Seeking a Summer 2027 internship.

Education

Georgia Institute of Technology | Atlanta, GA

Expected Graduation, May 2028

Bachelor of Science in Computer Engineering, GPA: 4.00

Dean's List with Faculty Honors (all semesters)

Skills

Programming: Java, Python, SQL, C/C++, Streamlit, SystemVerilog

Systems & Infrastructure: Lustre Parallel Filesystem, Kubernetes, NVIDIA GPUDirect Storage (GDS), Linux/ARM, Virtualization, GCP

AI & Inference: vLLM, LMCache, KV Cache Optimization, Distributed Storage Benchmarking, Computer Vision (MoGe, OpenCV)

Hardware & EDA Tools: Cadence Innovus, RTL-to-GDS Flow, Digital Logic Design, Verification, Physical Design

Data & Developer Tools: Git/GitHub, Google BigQuery, Datadog, Splunk

Languages: English (native), Mandarin Chinese (native)

Experience & Leadership

DataDirect Networks | Tokyo, Japan (Remote)

May 2026 – August 2026

Software Engineer I

- Built and deployed a Lustre parallel filesystem client from source, establishing a test environment used for all subsequent GPU-storage benchmarking work.
- Benchmarked NVIDIA Dynamo/KVBM inference serving against GPUDirect Storage, validating the data path end-to-end and quantifying time-to-first-token impact of offloading LLM KV cache to external storage.
- Deployed LMCache on Kubernetes and debugged an ARM platform incompatibility that blocked the standard install path; demonstrated 100% KV cache recovery from DDN EXAScaler storage after cache eviction.
- Automated performance testing pipelines and execution scripts, reducing validation cycle times for international teams.
- Collaborated with a Tokyo-based team to analyze telemetry metrics and implement system-level performance optimizations.

Manticore Games, Inc. | San Mateo, CA

June – August 2025

Software Engineering Intern

- Developed a player behavior analysis tool for Out of Time using BigQuery, Python, and Streamlit, processing 15M+ daily events.
- Designed a suspicion scoring system to rank accounts, analyzing database statistics to improve anomaly detection accuracy.
- Created a developer-facing dashboard for visualizing flagged accounts, reducing manual investigation time by over 80%.
- Delivered on stretch goals by engineering automated data ingestion pipelines (saving 6+ hours/week) and explainability metadata.

College of Computing, Georgia Institute of Technology | Atlanta, GA

Head Teaching Assistant for Discrete Math (CS 2050)

January 2026 – Present

- Teach occasional lectures and manage logistics of a foundational course with 500+ students.
- Manage a team of 25 TAs, coordinate grading workflows for exams and homework, and host weekly office hours.
- Lead proof workshop recitations to reinforce logic, set theory, number theory, and cryptography concepts.
- Conduct interviews and oversee hiring for prospective Teaching Assistants.

Publications

Mei, Olivia, Thomas Liu, Kaavya Kolli, Thomas Wen, Elizabeth Gillen, Sophia Blakely, and Benjamin Lee. "Reducing Noise Pollution with an Adaptive Barrier." In 2023 IEEE MIT Undergraduate Research Technology Conference (URTC), pp. 1-5. [IEEE](#), 2023.

Projects

Smart City Infrastructure | Vertically Integrated Project (VIP) Researcher

- Optimize ML and computer vision algorithms using Microsoft MoGe and GPS data for high-accuracy traffic sign localization.
- Collaborate on a smart-infrastructure sub-team to enhance urban data collection and transit mapping efficiency.

32-Bit Ripple Carry Adder | Digital & Physical Design, Verification Engineering Project

- Designed a 32-bit Ripple Carry Adder from the ground up using SystemVerilog.
- Verified and applied physical design flows and optimization techniques using Cadence tools.
